

Walk Away Diabetes Fact Sheet

What is diabetes? Diabetes is a disease in which the body does not produce or properly use insulin. Insulin is a hormone made by the pancreas that the body uses to convert the food that you eat into energy needed for daily life.¹

Who has or is at risk for developing diabetes? Diabetes currently affects **20.8 million children and adults** in the United States or approximately 7% of the population.¹ While we are all at risk for developing diabetes, there are some of us who are at a greater risk because of the following **known risk factors**:

- Family history
- Overweight/obesity as an adult or as a child
- Physical inactivity
- Gestational diabetes (diabetes during pregnancy)
- Ethnicity (Diabetes is more common in African-Americans, Latinos, Native Americans, Asian-Americans and Pacific Islanders)

Take the diabetes risk test: <http://www.diabetes.org/risk-test.jsp>.

What are the symptoms of diabetes? Typical symptoms of diabetes include:

- Frequent urination
- Excessive thirst
- Extreme hunger
- Unusual weight loss
- Increased fatigue
- Irritability
- Blurry vision

If you are experiencing any of these symptoms, please contact your healthcare provider.

How is diabetes diagnosed?

Diabetes is diagnosed with a “fasting blood glucose test” and is typically ordered by your healthcare provider after a complete history and physical exam. The only special requirement is that your blood be drawn after a complete 8 – 12 hour fast (overnight).

Can walking help me manage or prevent diabetes? Exercise, such as walking, can't hurt; studies show that *exercise does provide health benefits* to those with diabetes or who are trying to prevent the chronic disease.

Exercise also:

- Lowers blood glucose (sugar)
- Lowers blood pressure
- Lowers cholesterol
- Lowers risk for heart disease, stroke, and other chronic health problems
- Helps insulin work more effectively
